

Condition-specific PSTHs, recorded vs model
Model: free_free (per-unit context input), best restart per session by selection-set likelihood, mean over 5 noise draws. Verified successful trials.
Conditions: target location (columns) x reward on that trial (colour).
r: Pearson r over the 8 condition PSTHs (-300 to +600 ms from target onset).
Ceiling: split-half reliability of the recorded PSTHs (Spearman-Brown).
About 70% of trials were used for training: this shows fit, not generalization.

recorded, high reward
model, high reward
recorded, low reward
model, low reward
