a Models on task value range
b Models on monkey's 08-20 beliefs
c Robust to slower RTs (B, C)
S9: Spearman ρ(RT, value)
A
AE
B
C
monkey
S9
C (3 nets)
B (6 nets)
RT slowing, raised threshold (ms)
d RT vs true block value
e RT vs fitted belief, 08-20
RT, % change from mean
value of shown target (ms juice)
belief value of shown target (ms)
A / AE resolver
B priority hub
C outcome hub
hand-built network
08-20 vs fitted belief: ρ = -0.21 (n = 301)
its 95% bootstrap CI
08-20 vs true block value: ρ = +0.05
08-20, block-mean RT removed (e)
08-19 vs belief: ρ = +0.03 (n = 184)
Models w = 1 (value on every trial). d, e: networks closest to their architecture median (A_s2, B_s0, C_s5). RT normalised to each source's mean (models ~110-150 ms, monkey 221 ms).
