A resolver
AE resolver
B priority hub
C outcome hub
hand-built A / B / C
trained: median line, network range shaded
RT curves stop where any network of an architecture has too few
completed saccades into the injected field (A, AE, C and B at d 0.35);
muscimol RT undefined for the same reason in 10 of 24 networks.
All architectures show the same phenotypes (no resolver vs hub difference);
B is weaker (RT -15 to -21 ms at d 0.2; fewer fixation breaks).
